Note: After opening this file in Microsoft Word, update the Table of Contents field so page numbers appear automatically.

1. Introduction

This document is my Week-01 submission for the FlyRank AI Backend AI Engineering Internship. The objective of this task was to design a simple portfolio sitemap, configure the required AI tools, create a Claude Project with custom instructions, and evaluate the sitemap through a pressure-test prompt.

2. Portfolio Goal and Desired Action

Claim: I am building practical AI/ML and NLP skills through structured learning and hands-on projects.

Desired Action: Recruiters, mentors, or hiring managers should contact me for AI/ML internship opportunities.

3. Portfolio Sitemap

The portfolio is intentionally small and focused. Each page exists to support the claim and guide visitors toward the desired action.

Page	Purpose
Home	Introduce the claim and provide navigation to key sections.
AI/ML Projects	Demonstrate practical skills through projects and case studies.
About Me	Provide background, goals, and learning journey.
Resume	Allow recruiters to review qualifications quickly.
Contact	Provide clear methods for reaching out.

4. AI Toolkit Setup

The following tools were configured for this task:

- Claude
- ChatGPT
- Gemini
- Perplexity

5. Claude Project Configuration

Project Name: AI Portfolio Builder

Purpose: Build a portfolio that demonstrates practical AI/ML, NLP, and Generative AI skills while preparing for internship opportunities.

6. Pressure-Test Prompt Results

The sitemap was reviewed using Claude. Feedback confirmed that the structure was lean and recruiter-focused. The review highlighted the importance of strong project case studies, a clear positioning statement on the Home page, and simple contact methods.

7. Changes Identified

- Add a clear positioning statement on the Home page.
- Highlight featured projects on the landing page.
- Present projects as case studies rather than simple repository links.
- Keep the site focused and avoid unnecessary pages.

Figure 5. Claude Pressure-Test Output

Output:

Good sitemap to start from — it's lean, which is actually a strength for a student portfolio (recruiters skim, they don't read). Let me pressure-test it against your claim ("I build practical AI/ML and NLP skills") and your desired action (get contacted for internships).

1. Does it support your claim?

Partially. "AI/ML Projects" is the load-bearing wall of your whole site — it's the only page that can actually prove the claim. Everything else is scaffolding around it. The risk with your current sitemap is that a recruiter clicks Home → Projects and if the projects page is just a list of repo links or titles, the claim collapses. The sitemap structure is fine; what will make-or-break the claim is what's inside the Projects page (I'll get to that below) — not the site architecture itself.

One structural gap: nothing on your sitemap currently signals depth of skill independent of finished projects — things like specific tools, frameworks, or areas you've gone deep on (e.g., transformers, fine-tuning, RAG, prompt engineering). Right now that has to be inferred entirely from project descriptions.

2. Does it encourage the desired action?

Mostly yes — Contact and Resume are both present, which is the minimum requirement. But "desired action" isn't just "the page exists," it's "the person is convinced enough by the time they reach it to act." Two structural issues:

No clear path from a specific project to contacting you. If a recruiter is impressed by one project, can they act on that impulse immediately, or do they have to hunt for a Contact link in the nav? A CTA at the bottom of each project ("Interested in this work? [Contact me]") closes that gap.

Resume vs. Contact overlap isn't defined. Are these doing different jobs, or is Resume basically a PDF and Contact a form? If they're redundant, that's fine, but decide it on purpose.

3. What's missing

Skills/Tools section — not a fluffy "Skills: Python, TensorFlow" list, but a concise, honest inventory of what you actually know, organized by category (Languages, ML/DL frameworks, NLP tools, etc.). Recruiters scan for this specifically before opening any project. It can live as a section on Home or About, doesn't need its own page.

Individual project pages/case studies (not just a projects gallery). A grid of project cards with titles is not enough to prove skill — each project needs: the problem, your approach, what you built, what you learned, and a link to code/demo. This is the single highest-leverage thing you can add.

A one-line positioning statement on Home — "BS CS student building practical NLP/AI systems, seeking ML internship opportunities" (or your own phrasing) placed above the fold. Without this, a visitor has to work to figure out what they're looking at and why it matters.

I'm not suggesting a Blog, Certifications page, or Testimonials — don't add those unless you actually have content for them (per your instruction, I won't invent scope).

4. What's unnecessary

Honestly — nothing needs to be cut. Five pages (Home, Projects, About, Resume, Contact) is already close to minimal. The temptation for students is usually to add pages (Skills, Blog, Certifications, Testimonials) rather than remove them, which dilutes attention rather than building it. Resist that. Depth on fewer pages beats breadth across more.

The only thing I'd watch is About Me — this page is unnecessary if it turns into a general bio/hobbies page. It's necessary and valuable if it answers "why AI/ML, what's your trajectory, what are you working toward" in a way that's still recruiter-relevant.

5. What I'd improve — concrete next steps

Home: Add a one-line positioning statement + a "Featured Projects" preview (2-3 cards linking to full case studies) so the strongest proof is visible without a click.

AI/ML Projects: Convert from a list/gallery into individual case-study pages (or expandable sections) with: Problem → Approach → What you built → Results/learnings → Code/demo link. This is the biggest credibility lever you have.

About Me: Anchor it around your CS/AI trajectory and what you're actively building toward — not a general bio.

Resume: Make sure it's downloadable as a PDF and the content on it matches what's on your Projects page — inconsistency between the two is a common trust-breaker.

Contact: Keep it simple — email + LinkedIn is enough. Don't gate it behind a form if you can avoid it; friction kills the desired action.

If you want, send me what's currently on your AI/ML Projects page (even just project titles + one-line descriptions), and I'll help you restructure it into case studies that actually carry the weight of your claim.
